

GMU IT 357 Forensic Report

Mohammad shah

This is an educational project for a George Mason University course. Contents of this report are part of a fictional scenario.

THIS IS AN EDUCATIONAL PROJECT

By submitting this assignment, I certify I have abided by all requirements of the GMU honor code. I certify that this is entirely my own work, no unauthorized sources have been used, and all sources used have been properly cited.

Investigator Information

My name is Mohammad Shah. For this educational forensic exercise, I acted as a computer forensic examiner assigned to examine a forensic image of a USB flash drive. I am a graduate student in IT 357 at George Mason University, where I have been trained in the use of FTK Imager and Autopsy for forensic image verification and file system examination. My role in this exercise was limited to preserving the integrity of the provided evidence image, reviewing file system information, identifying files that matched the assignment categories, and documenting technical metadata in a way that a non-technical reader could understand. I did not interpret the meaning of any file content or draw conclusions about any individual's intent; I documented only the technical facts observed in the image, including file names, paths, timestamps, file types, and document properties.

Case Background

The FBI investigation in this case concerns threats posted on social media by James T. Buchs, a graduate student in the Master of Arts in Political Science program at George Mason University, residing in Beacon Hall on the Science and Technology campus. The FBI was in contact with George Mason University Police and the university's Violence Prevention Committee, which had received two prior reports concerning Buchs. After evaluating the social media posts, the FBI determined that probable cause existed to believe Buchs represented a credible threat to students and faculty at George Mason University. Based on this probable cause, the FBI obtained authorization to search Buchs's residence at 10945 George Mason Cir #212, Manassas, Virginia, 20110. During the search, agents located a USB flash drive, which was seized as evidence and transported to an FBI laboratory for forensic imaging. At the laboratory, Examiner R.J. Pollard created a forensic image of the flash drive using Access Data FTK Imager, version 3.1.0.1514. According to the acquisition report, the device imaged was a 1 GB SanDisk USB Ultra Dual Drive, silver in color, with no visible damage, and the imaging process began on October 18, 2024, at 07:32:46 and finished at 07:51:03 the same day. I received the resulting image file, IT357-GMU-Buchs.E01, along with its associated hash report, IT357-GMU-Buchs.E01.txt, as the evidence for this examination.

Evidence Analyzed

The evidence I examined was a single USB flash drive, described in the acquisition notes as a 1 GB SanDisk USB Ultra Dual Drive, silver in color, with no visible damage. Rather than examining the original physical device, I examined a forensic image of that drive — an Expert Witness Format (E01) file created by Examiner R.J. Pollard using FTK Imager 3.1.0.1514. A forensic image is a bit-for-bit copy of

the original media; working from the image instead of the original device preserves the original evidence by ensuring no analysis steps can alter it. I obtained the image file and its accompanying hash report directly from the case materials provided for this exercise

Verification of Evidence Integrity

Before examining any files, I verified that the image I received was identical to the image originally acquired by Examiner Pollard. I did this using FTK Imager's built-in Verify Drive/Image function. A hash is a digital fingerprint generated by running a file through a mathematical algorithm; changing even a single bit of the underlying data produces a completely different hash value. If the hash I calculate from the image matches the hash recorded at the time of acquisition, that match supports that the image has not been altered since it was created.

I loaded the image file into FTK Imager as an Image File source and ran the Verify Drive/Image function. FTK Imager calculated both an MD5 and a SHA1 hash directly from the image and compared them automatically against the hash values stored in the image's internal metadata and against the values listed in the acquisition report. Both hash values matched exactly, which supports that the image I examined is the same image originally created by Examiner Pollard and that it had not been altered prior to my examination. A screenshot of the FTK Imager results is provided in Appendix Item 2.

Forensic Tools

I used two forensic tools to conduct this examination. The first was AccessData FTK Imager version 3.1.0.1514, which I used to load the evidence image and verify its hash values using the built-in Verify Drive/Image function. FTK Imager is a widely used forensic tool in both law enforcement and corporate investigations because it creates and works with forensic images without altering the original evidence and provides a built-in mechanism for hash-based integrity verification.

The second tool I used was Autopsy version 4.23.1, developed by Basis Technology and the Sleuth Kit Labs. Autopsy is an open-source digital forensics platform used by law enforcement and forensic examiners worldwide. I used Autopsy to browse the file system, identify active and deleted files, review file and document metadata, and extract selected evidence items for documentation. I ran the following ingest modules: Recent Activity, Hash Lookup, File Type Identification, Extension Mismatch Detector, Embedded File Extractor, Picture Analyzer, Email Parser, Encryption Detection, Interesting Files Identifier, Central Repository, PhotoRec Carver, Virtual Machine Extractor, and Data Source Integrity. The Embedded File Extractor module was particularly important for identifying the OLE subitem embedded within Research.docx.

Overview

I conducted this examination by first verifying the evidence image hash values using FTK Imager, then loading the image into Autopsy for file system analysis. The evidence drive contained a FAT16 file system with a volume label of NONAME. The image contained 1,966,080 sectors at 512 bytes per sector, consistent with the values listed in the acquisition report.

The FAT16 file system organizes files in a flat directory structure using a File Allocation Table to track which clusters on the drive are occupied by each file. When a file is deleted on a FAT16 system, the first character of its filename in the directory entry is replaced with a deletion marker and the clusters are flagged as available, but the data remains recoverable until overwritten.

Autopsy identified a total of 146 deleted file system entries and 253 deleted files overall. The drive contained files across multiple categories including Office documents, PDFs, HTML files, images, plain text files, and executables. Several files were organized inside saved web page support folders, identifiable by the "_files" naming convention appended to the folder name. I reviewed the file system structure, selected the best examples from each required evidence category, documented their technical metadata, and exported their content for inclusion in the appendix.

Documents

Evidence File Name #1 (diaz, a - risk communication and the vt massacre.doc)

I located this item by browsing File Types → By Extension → Documents → Office in Autopsy, which lists all Office-format files recovered from the evidence drive. This file was active (not deleted) at the time of examination. The .doc format is a legacy Microsoft Word binary file format, also known as Compound File Binary Format, which stores document content, formatting, and metadata in a single binary file. The file system recorded a short (8.3) filename of DIAZ_A~1.DOC, which is consistent with FAT16 file system naming conventions that truncate long filenames. No embedded Office document properties (such as author or last saved by) were recoverable through Autopsy for this file; those fields would require opening the file in a compatible application. The file's starting sector address on the evidence drive was 51112.

File path: /diaz, a - risk communication and the vt massacre.doc

File name: diaz, a - risk communication and the vt massacre.doc

File type: Microsoft Word Document (.doc) — MIME type: application/msword

File status: Active

File size: 43,008 bytes

Modified time: 2024-01-10 09:23:48 UTC

Accessed time: 2024-01-10 00:00:00 UTC

Created time: 1980-01-01 00:00:00 UTC

MD5: 07da9b2443b7d8ad2484d6e2a1895be7

Appendix reference: Appendix Item 1

Evidence File Name #2 (*expense.docx*)

I located this item by browsing File Types → By Extension → Documents → Office in Autopsy, which lists all Office-format files recovered from the evidence drive. This file was deleted at the time of examination. In a FAT16 file system, a deleted file is indicated by a marker placed in the directory entry, and the clusters previously occupied by the file are marked as available for reuse. However, if those clusters have not yet been overwritten by new data, the file content remains recoverable. In this case, the file content was fully recoverable despite the deleted status.

The .docx format is a Microsoft Word Open XML format, which stores document content and properties inside a ZIP-based package structure. The file's short filename recorded in the FAT16 directory entry was _XPENS~1.DOC, which is the truncated 8.3 version of the full filename, consistent with how FAT16 handles long filenames.

File path: /expense.docx

File name: expense.docx

File type: Microsoft Word Open XML Document (.docx)

File status: Deleted (Not Allocated)

File size: 15,999 bytes

Modified time: 2024-01-10 09:08:28 UTC

Accessed time: 2024-01-10 00:00:00 UTC

Created time: 2024-01-10 09:08:04 UTC

Author/Last Saved By property: Not recoverable through Autopsy for this deleted file

MD5: 2b16b14ee875467ea366da3e07591c70

Appendix reference: Appendix Item 2

PDF

Evidence File Name #1 (*22-060-Fairfax-Map.pdf*)

I located this item by browsing File Types → By Extension → Documents → PDF in Autopsy, which lists all PDF files recovered from the evidence drive. This file was deleted at the time of examination, as indicated by both the File Name Allocation and Metadata Allocation showing as Unallocated in the File Metadata panel. In a FAT16 file system, a deleted file has its directory entry marked and its clusters flagged as available, but the underlying data remains recoverable until those clusters are overwritten. The file content was fully recoverable in this case.

The PDF format (Portable Document Format) is a file format developed by Adobe that presents documents independently of software, hardware, or operating system. The file's short filename

recorded in the FAT16 directory entry was _2-060~1.PDF. The file's starting sector address on the evidence drive was 67080.

File path: /22-060-Fairfax-Map.pdf

File name: 22-060-Fairfax-Map.pdf

File type: PDF document (MIME type: application/pdf)

Appendix reference: Appendix Item 3

Evidence File Name #2 (2019_All_Locations_Map.pdf)

I located this item by browsing File Types → By Extension → Documents → PDF in Autopsy. This file was active (not deleted) at the time of examination, as indicated by both File Name Allocation and Metadata Allocation showing as Allocated. The PDF format is a file format that presents documents independently of software or hardware. The file's short filename in the FAT16 directory entry was 2019_A~1.PDF. The Modified and Created timestamps both recorded 1980-01-01 00:00:00 UTC, which is a default epoch date indicating the original timestamps were not preserved when the file was written to this FAT16 volume. The file's starting sector address on the evidence drive was 50184.

File path: /2019_All_Locations_Map.pdf

File name: 2019_All_Locations_Map.pdf

File type: PDF document (MIME type: application/pdf)

File status: Active (Allocated)

File size: 421,553 bytes

Modified time: 1980-01-01 00:00:00 UTC

Appendix reference: Appendix Item 4

Graphics

streamprovider11.jpg

I located this item by browsing File Types → By Extension → Images in Autopsy, which lists all image files recovered from the evidence drive. This file was active (not deleted) at the time of examination. The file's internal path places it inside a folder ending in "_files," consistent with the naming pattern browsers use when a complete web page is saved — the

main page is saved as an HTML file, and supporting images are placed in this adjacent folder. The MIME type identified for this file was image/jpeg.

File path: /The Israel-Hamas war has college campuses on edge. How some are tackling the issue. - ABC News_files/streamprovider11.jpg

File name: streamprovider11.jpg

Appendix reference: Appendix Item 6

Deleted Files

Evidence File Name #1 (*Planning.docx*)

I located this item by browsing Deleted Files → File System in Autopsy, which lists files whose directory entries have been marked as deleted in the FAT16 file system. In a FAT16 file system, when a file is deleted, the first character of its filename in the directory entry is replaced with a deletion marker, and the clusters it occupied are flagged as available for reuse. However, the underlying data remains recoverable until those clusters are overwritten. The file content was recoverable in this case, though the MIME type identified was text/plain rather than a standard .docx MIME type, indicating the file content may not be a standard Word document despite its extension. The short filename recorded in the directory entry was _LANNI~1.DOC.

File path: /Planning.docx
File name: Planning.docx
File type: Identified as text/plain despite .docx extension
File status: Deleted (Not Allocated)
File size: 429,690 bytes
Modified time: 2023-03-27 16:56:50 UTC

Appendix reference: Appendix Item 8

HTML Files

Evidence File Name #1 (slved_res@urge(6).html)

I located this item by browsing File Types → By Extension → Documents → HTML in Autopsy. This file was deleted at the time of examination, as indicated by both File Name Allocation and Metadata Allocation showing as Unallocated. The file's internal path places it

inside a folder named after a saved web page about an Oxford, Michigan school shooting, with the folder ending in "_files." This is consistent with the naming pattern browsers use when saving a complete web page — the main HTML file is saved separately, and supporting files including scripts and style sheets are stored in this adjacent folder. The MIME type identified was text/html. The short filename recorded in the FAT16 directory entry was eAS36D~1.HUM.

File path: /Oxford, Mich. school shooting lasted 9 minutes, timeline
shows_files/slved_res@urge(6).html

File name: slved_res@urge(6).html

MD5: 8849831891636741c3963957e422a73c

Appendix reference: Appendix Item 10

OLE Subitems

Evidence File Name #1

OLE Subitem: image1.png (embedded in Research.docx)

I located this item by expanding the Research.docx file in the Data Sources tree in Autopsy. When Autopsy's Embedded File Extractor ingest module processes a .docx file, it extracts any embedded media items stored within the document's internal ZIP package structure and presents them as derived subitems beneath the parent file in the tree. This item is not a standalone file in the FAT16 file system directory — it exists only inside the parent document's package structure, which is why it is classified as a derived item rather than a file system item. In the Office Open XML (.docx) format, embedded images are stored internally under a path such as word/media/image1.png within the document's ZIP package. The file has no file system timestamps because it does not have its own directory entry — its existence is tied entirely to the parent document. The parent file `Research.docx` was located at the root of the evidence drive.

Parent file path: /Research.docx

Subitem internal path: /Research.docx/image1.png

Subitem name: image1.png

Subitem type: Derived — embedded PNG image inside .docx package

MIME type: image/png

Size: 8,093 bytes

File system timestamps: Not available (derived item, no directory entry)

MD5: 41fbe4091754cfa0ae51b32169e657d2

Parent file Author/Last Saved By property: Not recoverable through Autopsy

Appendix reference: Appendix Item 11

Summary

The forensic image IT357-GMU-Buchs.E01 was verified successfully using FTK Imager 3.1.0.1514. Both the MD5 and SHA1 hash values matched the values provided in the acquisition report, confirming the integrity of the image. The image contained a FAT16 file system. I examined the file system using Autopsy 4.23.1 and documented two Word documents, two PDF files, two graphics, two deleted files, two HTML files, and one embedded OLE subitem. Active and deleted files were identified across multiple directories. Several files were located inside saved web page support folders, identifiable by the "_files" naming convention. Two deleted files were identified with recoverable content, and one deleted file's content was not recoverable upon extraction. All technical findings were documented strictly as metadata without interpretation of file content.
